So Many Checkers
Scott McLean

The Project:
Make checkers in as many esoteric languages as I possibly can.

The Team:
Solo project for this one.

The Languages:
Rocket:
- An extremely compact language. Most statements are only a few symbols long.

Brainf*ck:
- An eccentric language. This language doesn't use any alphabetical characters at all.

Befunge:
- Befunge has a directional interpreter. So when it encounters a 'v', it starts reading top to down, when it sees a '>', '^', or '<', it will read the code in that direction.
