Class announcements

- Midterm next Tuesday!
  - Study guide posted

- Business Paper Proposals due today.

- Student Presentations Thursday (10/27)
  - Chi Hou Ip
  - Andrew Hale
Student Presentation

Scott Welch
Layering

Elaboration or specialization

Services

Existing layers
Example of Layering: networking

- **Application**
  - Messages
  - Transport
  - Packets
  - Network
  - Frames
  - Link
  - Bits
  - Physical
  - Signals
Software Layering

- Application
- Middleware
- Operating System
Operating system functions

- Graphical user interface (client only)
- Hide details of equipment from the application
- Multitasking
- Resource management
  - Processing, memory, storage, etc
- etc
Middleware Functions

- Capabilities that can be shared by many applications, but that is not part of OS
  - Example: Database Management System (DBMS)
- Hide details of OS from application
  - Java Virtual Machine
- More purposes we’ll talk about later.
What’s a database?

Database

- File with specified structure
- Example: relational table
## A Database

<table>
<thead>
<tr>
<th>Year</th>
<th>City</th>
<th>Accommodation</th>
<th>Tourists</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>
<td>Oakley</td>
<td>Bed&amp;Breakfast</td>
<td>14</td>
</tr>
<tr>
<td>2002</td>
<td>Oakley</td>
<td>Resort</td>
<td>190</td>
</tr>
<tr>
<td>2002</td>
<td>Oakland</td>
<td>Bed&amp;Breakfast</td>
<td>340</td>
</tr>
<tr>
<td>2002</td>
<td>Oakland</td>
<td>Resort</td>
<td>230</td>
</tr>
<tr>
<td>2002</td>
<td>Berkeley</td>
<td>Camping</td>
<td>120000</td>
</tr>
<tr>
<td>2002</td>
<td>Berkeley</td>
<td>Bed&amp;Breakfast</td>
<td>3450</td>
</tr>
<tr>
<td>2002</td>
<td>Berkeley</td>
<td>Resort</td>
<td>390800</td>
</tr>
<tr>
<td>2002</td>
<td>Albany</td>
<td>Camping</td>
<td>8790</td>
</tr>
<tr>
<td>2002</td>
<td>Albany</td>
<td>Bed&amp;Breakfast</td>
<td>3240</td>
</tr>
<tr>
<td>2003</td>
<td>Oakley</td>
<td>Bed&amp;Breakfast</td>
<td>55</td>
</tr>
<tr>
<td>2003</td>
<td>Oakley</td>
<td>Resort</td>
<td>320</td>
</tr>
<tr>
<td>2003</td>
<td>Oakland</td>
<td>Bed&amp;Breakfast</td>
<td>280</td>
</tr>
<tr>
<td>2003</td>
<td>Oakland</td>
<td>Resort</td>
<td>210</td>
</tr>
<tr>
<td>2003</td>
<td>Berkeley</td>
<td>Camping</td>
<td>115800</td>
</tr>
<tr>
<td>2003</td>
<td>Berkeley</td>
<td>Bed&amp;Breakfast</td>
<td>4560</td>
</tr>
<tr>
<td>2003</td>
<td>Berkeley</td>
<td>Resort</td>
<td>419000</td>
</tr>
<tr>
<td>2003</td>
<td>Albany</td>
<td>Camping</td>
<td>7650</td>
</tr>
<tr>
<td>2003</td>
<td>Albany</td>
<td>Bed&amp;Breakfast</td>
<td>6750</td>
</tr>
</tbody>
</table>
Storage Middleware example: DBMS

- Database Management System (DBMS)
  - Manage Multiple databases
  - Allow multiple applications to access common databases
  - Implement standard data “lookup” (query) functions.
The Internet

by

David G. Messerschmitt
What is the Internet?

- An internet is a “network of networks”
  - Interconnect standard for LAN’s, MAN’s, and WAN’s
- Internet = the major global internet
- A private internet is called an intranet
- An extranet is an interconnection of intranets through the Internet
**Intranet**

*Private* internet

Often connected to Internet

- **Firewall** creates a protected enclave
Extranet

An Extranet is composed of

- Intranets *connected through an unprotected domain* (typically the Internet)

- Encryption and other security technologies used to
  - protect proprietary information
  - prevent imposters, vandals, etc
Communication between intranets encrypted.
Client - Server Computing
Client Server Example

Client

“I want to see www.google.com”

Server

<html><head><meta http-equiv="content-type" content="text/html; charset=UTF-8"><title>Google</title><style><!--
body,td,a,p,.h{font-family:arial,sans-serif;}
.h{font-size: 20px;}
.q{color:#0000cc;}
//-->
...
Client Server Example - Layers Revealed

Client

Application:

3-Tier Client Server Architecture example

Client

Clicks, keystrokes

Application Server

What is Bob’s balance?

$0.50

Shared data
3-Tier Client Server Architecture example
3-Tier Client Server Architecture example

- **Client**
- **Application Server**
  - **Web Server**
  - **Application Logic**
  - **Database Management System (DBMS)**
  - **Database**

Shared data

What is Bob’s Balance?
3-Tier Client Server Architecture example

In some implementations, Application Logic and Web Server can be put on different machines.

Client

Application Server

Web Server

Java Servlet

Database Management System (DBMS)

Database

Shared data

What is Bob's Balance?
## Relational Database

<table>
<thead>
<tr>
<th>Customer</th>
<th>Balance</th>
<th>Customer Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alice</td>
<td>$527</td>
<td>Silver</td>
</tr>
<tr>
<td>Bob</td>
<td>$0.50</td>
<td>Bronze</td>
</tr>
<tr>
<td>Charles</td>
<td>$1000000</td>
<td>Gold</td>
</tr>
</tbody>
</table>
DBMS Responsibilities

- Hide Changes in the Database hardware from the Application

- Standard operations on the data, including searches, such a search is called a **query**.

- Separate Database Management from Applications, so that many applications can access the same data.

- Security, Integrity, Backup, fault tolerance, etc.
3-Tier Client Server Architecture in General

Client
- Accept instructions from user
- Make requests of server
- Display responses of server

Application Server
- Takes inputs from client
- Decides what to be done next
- Decides what shared data to access and manipulates it
- Processes shared data

Shared data
- Support multiple applications with common data
- Protect critical data
- Decouple data administration and application administration

Peer to Peer

- What is peer to peer good for?
Sun Case

Peter Yao
Sun N-tier case

- What does Sun make?
  - Workstations
  - Servers
  - Software
How Successful had Sun been up to 1998?

- Founded in 1982
- Open Standards Workstation
  - Unix Operating System (Solaris)
  - TCP/IP networking
- 1988 – Revenues $1 billion
- 1993 – Market value $3.0 billion
How Successful had Sun been up to 1998?

- 1993 - “The network is the computer.”
- 1994 - Internet explodes in popularity
Microsoft mid to late 90s

- *Dominated Desktop software*
  - Users familiar with Windows, Office, etc.

- *NT servers*
  - Fine for small intranets, “not industrial strength”
What is Java?
- Programming Language
- Portable between computers with different operating systems
- Easy to write programs in
- Easier re-use
- But, programs are slow
What problems did the micro era produce?

- Desktops are expensive to maintain
  - TCO for windows PC $9900!

- Every PC had a lot of software that had to be maintained
  - Office, Windows, etc...

- Small differences, like the order in which software is installed, could make different PCs behave differently!
In the Networking Era

- These “bloated” PCs are networked and termed *fat clients*.
- But networking of PCs offered the possibility of
  - putting most of the functionality into servers
  - *Getting rid of much of the software on the client*
  - These clients would be called *thin clients*.
  - Sun, Oracle, and others saw it as the future.
Hardware for thin clients

- A **Network Computer** (NC) - a computer with minimal hardware that depends on a network connection to a server to function
  - Be careful not to confuse it with the phrase “networked computer!”
  - Example: Sun’s JavaStation (1996-2000)
  - It is the hardware one would use to implement a thin-client computing model.
Another term from that era..

- A *NetPC* was a PC introduced by Microsoft and Intel in 1996
  - Same software as a normal PC
  - Did not allow users to install their own software
  - NetPC died out
  - Features of it, and Microsoft’s Zero Administration Kit, live on in today’s version of Windows.
Microsoft Vision

- Keep “fat-client” model
- Add some features to Windows to reduce administration costs
Sun’s Vision

- Thin Client model.
- Application Servers with Applications written in Java.
- NCs could retrieve applications from application server as needed.
- Applications compatible with any NC hardware and OS.
- Applications could be fixed, added, updated at the server level, rather than maintaining each PC.
SUN 3 - Tier

Exhibit 1 Three-tier Architecture

Tier Three

Asia

Tier Two

United States

Tier One

Europe

Applets
App Server

These had to be managed locally. If code needed to be updated, each app server had to be shut down, updated and rebooted

Client Applets
Client Hardware

Client Applets
Client Hardware

HTTP
RMI

JDBC: Stands for Java Database Connectivity. It is a programming interface that lets Java applications access a database via the SQL language. RMI: Stands for Remote Method Invocation. It is the method by which a remote Java object from one location can be invoked from other Java virtual machines. HTTP: Stands for HyperText Transport Protocol. It is the communications protocol used to connect to servers on the World Wide Web.
Sun N-tier

Tier One

Tier Two
Webtop Server

Tier Three
Webtop Server

Tier Four

Asia

United States
App Server
database
app server talks to central database
If bug found, change code here. Next time, corrected applet is sent down

Europe

applet cached
1st time Servlet sent
1st time, applet sent

Client

Client

Client

Client

Client

Client

Client
**Step 1:** The user logs into his client and calls down an application. This message is sent to the Application Server.

**Step 2:** An initial applet is sent to the client. At the same time a servlet is sent to the Webtop Server.

**Step 3:** The applet talks back and forth with the Webtop Server via the LAN.

**Step 4:** As new data is received (i.e., a new customer's name) the App Server communicates with the database to update that information.

**Local:** The Webtop Server and client communicate via a LAN.

**Remote:** The database and App Server communicate with the Webtop Server via a WAN.
Sun’s Performance

355.8 476.4 762.4 762.9 1,031.3 1,854.0 927.0 (587.0) (3,429.0) (388.0) (106.0)
Today

- 3-tier model common.
- Sun’s version of 4-tier model not-common.
- N-tier model where Webserver and Application Server on separate equipment also common.
- Sun’s hardware business not strong.
  - Linux on cheap PCs most common servers
  - Microsoft desktops replacing Sun workstations
Today

- **Java**
  - Common in Server implementations
    - Example: Java Servlet implementing application logic in a banking application.
  - Often used to push simple applets onto client
  - Not common
    - For “big” desktop applications
    - Office Suite in Java not popular
  - Microsoft is still in business...
